We have recently identified several new genes for the immediate early antigens IE180, ICP0 and ICP4. The main objectives of this research are to analyze the contribution of these genes to herpesvirus biology and to test the biological relevance of these genes. The three IE genes are important regulators of the herpesvirus life cycle, and their products interact with many aspects of the viral life cycle,

including transcription, replication, and the regulation of expression of cellular and viral genes. The two ICP genes are essential for the viral life cycle. The functions of the three IE proteins have been studied in some detail, and their targets have been identified. However, very little is known about the functions of the two ICP proteins. The three IE proteins and their interactions with the viral DNA polymerase and the viral terminase, for example, are of great interest, but so far these have not been characterized in any detail. The goals of the first project are to determine if the IE proteins are part of the viral DNA polymerase holoenzyme, and if they affect its function. In addition, we will use in vitro and in vivo assays to see if the IE proteins are part of the viral terminase complex. The goals of the second project are to analyze the interaction of the three IE proteins with cellular transcription factors and other cellular proteins, and to determine what these interactions regulate in the viral life cycle. The final goal is to investigate how the three IE proteins contribute to the pathology of herpes simplex virus infections. It's easier to charge multiple devices at once with a power bank. Easy and better. The Nubo 20,000mAh power bank charges four devices at once with five different cables, and it's smaller than an adult human ear. The basic Nubo battery has to be charged via Micro USB cable with Android and iPhone support. Nubo is pretty small -- it measures 1.2cm by 0.3cm by 0.3cm -- which is pretty small. It is light 2d92ce491b
