The openings can be naturally occurring or iatrogenically created, depending on the surgical procedure, and can be formed in various structures of the body, such as the intestine, colon, stomach, lung, pancreas, liver, kidney, etc. There are a number of surgical staplers for various procedures. However, many of these staplers are configured to operate according to one of two different principles. A first type of stapler uses an actuation mechanism or handle to move a knife or other cutting member and staple cartridge to sequentially eject the staples from the staple cartridge and form the staples into a generally B- or U-shaped configuration. This type of stapler is common for use in stapling an opening in a patient's intestine or other organic tissue. The general type of stapler and it's operation are disclosed in U.S. Pat. Nos. 2,051,257 and 2,140,957. A second type of stapler moves the cutting member and staple cartridge simultaneously, such that the staples form a generally C- or O-shaped staple. The C- or O-shaped staples are most often used in 2d92ce491b
