Inflammatory bowel disease (IBD) was present in 15 patients (31%), 11 had hepatocellular carcinoma (HCC) (23%), and 17 had end-stage liver disease (36%). Peripheral cholangiography was not useful in making a preoperative diagnosis of IBD or HCC. Cholangiography revealed sclerosing cholangitis in 31 patients (66%). Grossly, the liver was enlarged in 55% and icteric in 27%. Cholangitis was present in the ileum in 28%. Lymphoid nodules were present in 40% of the ileum, 31% of the colon, and 43% of the duodenum.
