Hansoft Stress Tester is an easy-to-use platform-independent tool to perform stress tests on your Hansoft servers. The program simulates client actions, processes requests and increases the load on the server. It can be used to measure the number of requests the server can handle per second and to analyze the load on your server. User and group data can be tested, as well as the status of the servers, clients, users and groups. It allows setting parameters such as delay between the requests, the number of client requests, which page should be shown after each request and the page size for data in request. The server can also be tested with random user data. Hansoft Stress Tester allows setting any kind of commands, such as delete, edit, create, query or insert. Test Hansoft server's performance with minimum effort. Allows to run stress testing without creating any projects, users, or clients. The stress test simulates maximum load and time out test for Hansoft server. The ability to run this test on demand, allows you to check the server's performance just by running stress test at any time. The test is configurable and is performed with timeout interval. It gives you an overview on the time the server took to process a specific request. You can specify the test duration and repetition interval. This can be useful when the server is unstable or you want to see how the server behaves in long operation test. You can also specify HTTP headers, login, password and cookie information when testing an authenticated Hansoft server. This tool is created on the request from a customer that wanted to verify the proper operation of the server under maximum load for long time. If you want to perform this test on demand please look at our software named Hansoft Stress Tester. Hansoft Stress Tester runs either as a service or as a command line tool. With stress tester you don't need to create projects, users or clients which makes this tool more powerful and less time consuming. In addition, you have the possibility to also import the server's configuration by editing the.config files. Just import them. If you are not familiar with CFG files then don't worry, you can just import the configurations into Hansoft Stress Tester and test the server yourself. You can use this program to check the server's performance under maximum load by specifying the number of projects, users, and clients. The configuration process is easy, just install this program, right click on file hansoft_stress_tester.exe and hit the Import button. You can also import an existing config file in the project's folder. Just import that file by double clicking it. The program runs as a Windows Service so you can keep it active and restart it if you want. You can change the name by editing the configuration files or programmatically by using the service name. You can launch stress tester on demand by right clicking on the program's icon. This program saves the data in a.dat file. The Hansoft FTP Server allows you to upload and download files to and from your FTP server by using the Hansoft FTP Server Management. It is available as a free, standalone application for Windows and Linux and as a service on Mac OSX. The
