Should one always use question mark for optional parameter in jquery? I mean i have seen people using question mark only in optional parameters. What is the need behind it? I know in PHP

you have got it as true in the documentation, but in case of jquery there is no such thing. So what is the reason behind using them? A: You only use it if you have to. For example: $.ajax({ url:'some/path/to/file.html?someParameter=true', // ^^^^^^^^^ success: function(data) { // do something with the result } }); In this example, the parameter is required because it's after a?. In this case, we can omit the?. This is because it is more often than not that we are trying to pass multiple parameters to the same URL. For example, some page needs two parameters: Login Password A request could be: It is tempting to use the same URL for both, for

Ashfaq Ahmed, eletronica de potencia ashfaq ahmed pdf 60: Advertência. DATA: 19/11/2005, TÓPICOS: 25, Download and Read Eletronica De Potencia, Vol. 3, Edited By.pdf online.In recent years, it has become necessary for various industries to have information about the products which they produce available to the public. In order to provide the public with the desired information, different forms of informational material have been developed. For example, a high density informational medium such as a data medium (e.g. CD ROM) may be used in order to convey information about the products. However, most of the mediums currently available are used to convey only information and are not capable of

providing a user with an interactive experience. One of the main reasons for this is that there is currently no method for conveying a user experience to the user. For example, it is known that when a user reads about or sees an advertisement, the user typically has a feeling of interest in the product or service being described or advertised. However, if the user is asked to "press this button to make a purchase", the user's interest in the product may be diminished. Therefore, in order to provide an appropriate experience to the user, it is preferable to let the user interact with the product or service as if the user were actually involved in the application. For example, it is well known that when a user drives a car, the user typically pays

attention to the radio and/or the audio system so that he may enjoy the music he is listening to. However, if the user is asked to select between radio stations and to switch between them by pressing a button, the user's enjoyment of the music may be diminished. It is known that user's experiences with information technology products have been greatly enhanced by the introduction of graphical user interfaces (GUI). In a GUI, a mouse or other input device can be used to position a pointer on a screen. The user can click on icons to select commands or items. Similarly, a common style of GUI is to enable the user to manipulate objects on a computer screen with the use of a keyboard. For example, in some GUIs, the

user can select a word using the keyboard and then delete it. In many of the current GUIs, the user is required to use an input device such as a keyboard or a mouse. When the input device 4bc0debe42
