

Photoshop's use has exploded, and it has become the primary tool for design, web and print. Whether you are a beginner or an expert, there are many helpful resources out there to get you started. Here are a few resources that cover the basics, from free to advance tutorials. As with any program, it takes time to learn, so be patient, and keep at it. Avoiding the most common mistakes Despite its name, Photoshop isn't the only editing program out there; Adobe's other multimedia programs—like the Adobe Flash Studio and Dreamweaver—are good alternatives to Photoshop for web design and development. Start by familiarizing yourself with Photoshop's interface. Some folks like to open an image and start making changes, others like to create a document and apply changes one item at a time, like adding a gradient or text. Once you are comfortable with the interface, learn the basics of file structure, such as layers and selection. Learn about the various tools available such as filters and masks. Learn about layers, object selection, brightness, contrast, and all the other basic tools. Browse and play around with different types of editing software: photo editing software like Adobe's Photoshop is a different paradigm than video editing software like Adobe's After Effects. When starting out with Photoshop, a lot of the time it's harder to get started than it is to keep going. Focus on the basics. First, don't learn to use a program to do something you can do on a website. Learn the basics of doing on a website instead; in other words, use a framework such as HTML, CSS and JavaScript. Only then should you start learning to use Photoshop, or any image manipulation software for that matter. Using graphic applications There are many other great graphic editing applications to learn from. They include Corel Draw, Illustrator, InDesign, Paint Shop Pro, QuarkXPress and Fireworks. All of these are powerful programs that can help you design websites as well as print, but each has its limitations, and none of them is for every kind of design you might need to create. Corel Draw is very friendly, but the learning curve is steep, and there is also quite a price to pay for it. It's a must try if you're just getting started; however, it's not a great choice for those looking to manipulate large files. Corel Draw's core functions cover illustration, image editing,

BANGKOK — It was a love match made on the Internet. Two teens met online and decided to share the rest of their lives together, moving to Malaysia to marry on Feb. 21. At a small ceremony in a Kuala Lumpur garden, the two Malaysian youths got married in the presence of only family and friends. ADVERTISEMENT Lim Teh Hoon, 20, from Ipoh, Perak and his wife, Sarah, 18, from Kuala Kangsar, Perak, are now hoping to have a family of their own. “I was always looking for a suitable partner,” Lim told the media after the marriage, expressing how excited he was to get married. Sarah said she used to visit Lim’s house because he and his family liked the way she laughed and the way she cleaned her room. The couple sent their invitations and the marriage contract to friends on Facebook before they decided to get married. Sarah was the first to accept Lim’s proposal on Nov. 24 and traveled to Malaysia with a friend to prepare for the wedding. Sarah said she felt Lim’s proposal was a surprise and took about a month to respond to him. “I could not understand the meaning of the marriage proposal until I traveled to Malaysia. It was a very special and beautiful feeling,” she said. They went to the Kuala Lumpur garden where their wedding ceremony was held on Feb. 21, while another close friend from the wedding ceremony, Chong Chun Keong, was baptized by a Catholic priest a few days before the event. ADVERTISEMENT The Lims will now have to wait for six more years, when they have to be in Malaysia for another round of wedding ceremonies to have their children. “We will try to fulfill our commitments to each other. We also plan to live in Malaysia for six years for a more solid relationship,” she said, adding that Lim’s father, Lim Ah Kee, attended the wedding. Sarah also revealed that she told Lim that she could not accept his marriage proposal in Singapore since her family was already living in Malaysia. “I have to study at the Universiti Teknologi Malaysia, but I have to look after my family in Malaysia,” she said. Lim said he was happy to marry Sarah, even though her family was not present at the wedding.

Q: Storing a list of complex objects from a database in memory I am trying to store a group of complex objects in memory so I can easily access them. The objects have a potentially large number of properties, so a single object is not ideal. Also there could be some properties that the user doesn't need. And finally there's the chance that objects could be added or removed from the group. I want to do this because I might not want to add them all to a collection in memory, and I want to be able to remove some of them when they go out of scope. I want to know the best way to do this. I've tried using the .NET Framework's 'File' objects, but it's a bit awkward since I don't have all of the properties. Any good alternatives? A: I'd go with a dictionary for the storage. That way you can add as many objects as you want without having to worry about growing the storage. It's also easy to add new objects to the dictionary without worrying about getting out of synch with the database. The dictionary doesn't need to know the order of the objects. Edit: Per request, here is a code snippet. Note that if you are storing many objects, it may be more efficient to use a generic list rather than a dictionary.

```
var dict = new Dictionary(); // Add an object to the dictionary here var curObjName = "Object 1"; var curObj = dict.GetValue(curObjName); // curObj will be null because it hasn't been added to the dictionary yet var newName = "Object 2"; dict[newName] = new MyObj(); // Now curObj gets populated
```

 A: I use the same approach. However I have a class for each row in the database (with ID as primary key), and instead of making a list of objects for every row I have a list of lists of objects. When reading a row from the database I check if the object was already read. If it was I don't add it again, if it wasn't I copy it from the first list of objects, and add the new row to the next list (so there is only one copy of the object in the list). This could look like this (you'll need to modify the code a bit, but this is the concept I'm using)
