Explanation: "%sourcepath%" -- The location of the Windows setup source path to be used for installing Windows Media Player 11 into your Windows source files (it is the same path you use to install any other Windows product). For example, for the path of C:\Windows\Setup, you might enter "C:\Windows\System32\Setup\CommonFiles\Setup.exe" C:\Windows\System32\Setup\CommonFiles\Setup "" -- A quote character, which is needed as most command-line interpreters require it for escaping characters that are interpreted as special. (The quote character itself is not special.) "WMP11" -- The name of the application to be installed into your Windows source files. You might see the following entry in Windows XP: "WMP" and the following entry in Windows Vista: "Windows Media Player 11". "x64" -- The file you want to integrate with the setup source path location is the x64 version of the file (e.g., if your computer is using the x86 architecture, you should select the 32-bit version). You may need to install the .Net Framework 4 first, or have the setup source path already added to your path environment variable. "CommonFiles" -- The name of the setup folder where Windows Media Player 11 is to be integrated in your Windows source. For the default Windows Vista installation, this is C:\Windows\Media. "%targetpath%" -- The location to install the selected Windows Media Player application into (it can be a folder or the directory level). This is where the application will be installed on your computer, assuming that you selected a folder as the target. If you haven't created the path yet, then this section will expand to let you change this (including creating the path if it is not present). "C:\Program Files\Windows Media Player\wmpplayer.exe" -- The application to be integrated. Bugs: None detected.
