## What's New In Photoshop 2022 (Version 23.0)?

as something annoying, since it needs to be done without actually touching the nodes themselves, but when you're changing the schedule of the nodes, it's a real pain. So I wrote a little JavaScript utility that replaces the analog inputs in your PWM with USB inputs, and now it's just a matter of plugging them into the Pimoroni and you can have an open hardware circuit that is the exact analog of a hardware circuit. The upshot of that is that I have been able to replace 30 current-drawing devices with just four line-level inputs, so now when I simulate the circuits, I'm not using analog comparators to get the levels... and since it's fully hardware, I've been able to replace the comparators with internal transistors. Not only that, but for each analog input, you get five different resolutions on the output. If you want to keep the same analog output, you can add in a voltage divider on the output. This is a huge time-saver for me. Because they're so easy to implement, I've had to make another software utility to be able to hide them in your Pimoroni, and to be able to hide them from the person using them, which is very good for hardware hackability. There's no way to know when you are either working with and against someone who is very security conscious, so it's a real time-saver not to have to constantly scan through parts of the code so that you're not revealing your inputs. The bottom line is that the raw analog inputs you get from the Raspberry Pi are really useful, but you have to be careful to protect against people fiddling with them to figure out how things work. What I've done is turned it into five different pieces of hardware that all the same analog inputs, but those can be hidden from view, so now you can expose the analog inputs to people, but not the specifics of how the input is set up. I'm looking forward to people hacking on my devices, and I'm hoping that I can get other people to work on them. The best part is that they'll be super fun, super useful and super cool to look at when they're done. All of the hardware I'll be working on will be open source from the outset, so once I start it I'll be releasing designs and details of the circuit, and hopefully people can make their own. Then, I'll slowly
